

IN THE CLAIMS

Claims 1-15 are presented below:

1. (Currently Amended) A communication node comprising:
- means for dividing a packet to be transmitted into segments to form a plurality of packet segments;
- means for selecting an error correction scheme, from among a plurality of error correction schemes to be employed, for each of the packet segments in accordance with error resistance of each of the packet segments, the error resistance being determined at least by the content of each packet segment;
- means for carrying out an error correction process on each packet segment with the selected error correction scheme; and
- means for transmitting each processed packet segment to a network.
2. (Canceled.)
3. (Original.) A communication node according to Claim 1, further comprising:
- means for negotiating with another communication node connected to the network, prior to transferring the plurality of packet segments, the error correction scheme to be employed in relation to particular packet segments.

4. (Canceled.)

5. (Original.) A communication node according to Claim 1, wherein each of said plurality of packet segments has a field identifying the selected error correction scheme, and

1
D
amul.
said communication node further comprises means for identifying, in said field, said information corresponding to the selected error correction scheme.

6. (Canceled.)

7. (Original.) A communication node according to Claim 1, wherein each of said plurality of packet segments has a field identifying the selected error correction scheme, and

said communication node further comprises means for negotiating with another communication node connected to the network, prior to transferring the plurality of packet segments, the error correction scheme to be employed in relation to particular packet segments.

8. (Canceled.)

9. (Original.) A communication node according to Claim 1, wherein the error correction scheme employed for a particular one of said packet segments has a higher correction ability than another error correction scheme employed for the other packet segments.

10. (Canceled.)

11. (Canceled.)

12. (Original.) A communication node according to Claim 1, wherein the selecting means determines the error correction scheme by referring to a higher-level protocol field of said packet.

13. (Original.) A communication node according to Claim 1, wherein the selecting means determines the error correction scheme by referring to a port number in said packet.

14. (Currently Amended.) A packet transferring method comprising the steps of:
dividing a packet to be transmitted into segments to form a plurality of packet segments;
determining an error resistance of each of the packet segments at least by the content of
each packet segment;

selecting an error correction scheme from among a plurality of error correction schemes to be employed for each of the packet segments in accordance with the error resistance of each of the packet segments;

carrying out an error correction process on each packet segment with the selected error correction scheme; and

transmitting each processed packet segment to a network.

15. (Original.) A packet transferring method according to Claim 14, further comprising:

receiving the packet segments from the network;

determining the selected error correction scheme from the plurality of error correction schemes to be employed for each of the received packet segments based on predetermined information contained in each received packet segment;

carrying out an error correction process on each received packet segment with the selected error correction scheme; and

forming the packet from the plurality of processed packet segments.
